

# Incident Response Tabletop Workshops

The worst time to test your incident response plan? When you need it most. Instead, you need to know you'll be ready for a worst-case scenario, be it a data breach, a ransomware attack, a data center outage or whatever other form it may take.

Plans that exist only on the page are prone to falling short of expected results when called upon. It is only by putting them into practice and stress testing them in a safe environment that critical gaps and shortfalls can be revealed and, ultimately, addressed. Doing so ensures a plan is fully ready and optimized for real world threats.

## STEP INSIDE YOUR OWN CYBER SECURITY WAR ROOM

The Arraya Cyber Team's **Incident Response Tabletop Workshops** simulate the kind of scenarios that keep security professionals up at night. They allow participants to choose a disaster and then spend a day working through their response to it in order to determine a true level of preparedness. Workshops are designed and intended to involve stakeholders from across the org chart, reinforcing the notion that cyber security is everyone's responsibility

Workshops begin with a fictional incident and follow every step of the subsequent response process through remediation. The exercise will allow attendees to:

- discover if their policy adapts to dynamic threats
- ensure stakeholders are knowledgeable of their roles and responsibilities as they pertain to incident response
- uncover possible gaps in policy that only surface when tested
- gain clear, tangible remediation guidance through after action reports
- assess the capabilities of existing resources and identify resource gaps
